

Stargazing: Geminids Meteor Shower

written by John Mueller | September 24, 2021

The Geminids Meteor Shower has a large number of meteors per hour, with up to 120 multicolored meteors per hour at its peak.

This meteor shower is a result of debris left behind by the 3200 Phaethon asteroid.

Note: There might be a distraction with the moon and it's light during these nights.
